

Another issue that people are facing is lack of facilities.

Especially in rural areas in developing countries, and mainly because of economic problems, there is no infrastructure to obtain water and channel it.

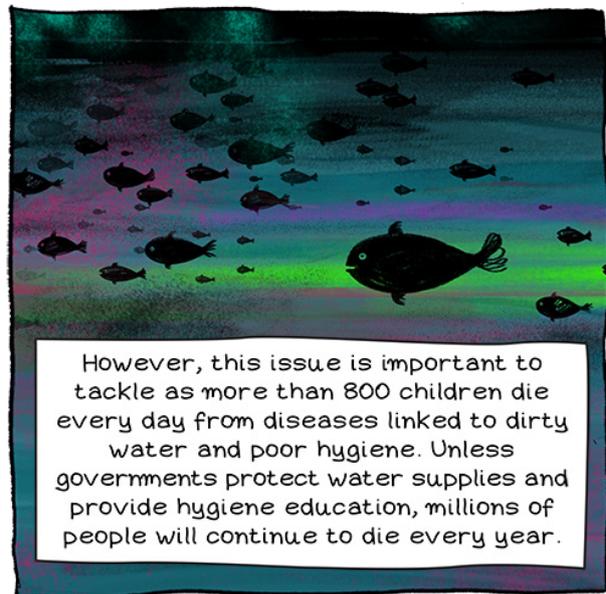

Women and children have to travel long distances in order to find water, often from rather unsafe sources, and carry it back home.

To solve this problem, governments should invest in water desalination and supply households with water that is clean and safe to drink.

To sum up, undoubtedly toxic waste and poor infrastructure affect access to water and sanitation.

However, this issue is important to tackle as more than 800 children die every day from diseases linked to dirty water and poor hygiene. Unless governments protect water supplies and provide hygiene education, millions of people will continue to die every year.
