

It is argued that one third of the food produced for human consumption each year is wasted.

Moreover, many countries use more products than can be sustainably produced.

Households around the world actually devour almost thirty percent of the global energy

and contribute a high percentage of CO² emissions as a result.

In conclusion, many people wrongly assume that our planet can provide unlimited fossil fuels and food.

We need to understand the environmental impact of manufacturing and food production and start rethinking our behavioural patterns. Radical changes to how we live are needed to lead to a more sustainable lifestyle.
